Nouqta - Polish Pass (from the screen recording)

You are a senior frontend engineer. Follow the Nouqta blueprint PDF
(Sections 2, 4, 7, 15.1, 16). All learner text stays in French. Fix ONLY
what is listed. Do not add features (put ideas in "Suggestions"). For
every bug write the ROOT CAUSE in one or two sentences first.

PHASE A - TRACING SCREEN (overloaded and overlapping)

Problems seen: the title ("Pratique...", "Tracer...") is cut and hidden
behind the Pratique/Fantome buttons; the "GUIDE" label is cut; the
screen has about 9 buttons and two status messages; the canvas is not
the hero.

Rebuild the layout from top to bottom:

1. Top bar: close button, 5-step bar (icons + labels), letter name at the
   right. Nothing else on that row.
2. One small status line under it: "Trait 1/2" or "Points". Never
   truncated, never overlapped.
3. The canvas: the hero, at least 85 percent of the screen width,
   square, centered.
4. Under the canvas, ONLY three icon buttons with labels: Effacer,
   Animation, Guide (1/3).
5. Sticky bottom: the saffron "Valider" button.
6. Move everything else out of the main view:
   - "Pratique", "Fantome", "Garder", "Recommencer", history: appear
     AFTER a successful validation, in a bottom sheet "Ton essai"
     (Garder, Recommencer, Fantome toggle, history strip).
   - "Passer cette etape": a small text link in a "..." menu, not a
     big button.
7. Status messages ("Tres bien", "Guide valide"...) appear as a toast
   at the top for 2 seconds, never inside the layout.

PHASE B - DOTS STEP IS FRUSTRATING

Problem seen: the learner taps on a dashed target and still gets "Un
point de trop". The two targets for Taa are almost touching and small.

1. Find the root cause: log every tap (x, y, nearest target, distance,
   current dot count). Check for double counting (touchstart + pointerdown
   - click all registering), and for taps that miss a target being
     counted as extra dots.
2. New behaviour:
   - Use pointerdown ONLY, once per tap.
   - A tap snaps to the nearest EMPTY target within 56 px and the dot
     pops into place. A tap farther away is ignored with a gentle hint
     "Touche les pointilles".
   - Tapping an already placed dot removes it (undo).
   - Never show an error before the learner presses Valider. On Valider:

too few -> "Il manque un point", too many -> "Un point de trop".

3. Targets: each touch area at least 48 px; targets spread so they never
   touch (minimum gap = one dot diameter); in guide mode 1 they pulse
   softly.
4. Selftest: simulate taps on every target of Taa, Thaa, Qaaf, Yaa and
   confirm the count equals the target count and validation passes.

PHASE C - HOME POLISH

1. Header: the app name shows as "Nou..." (cut). Show the full "Nouqta"
   wordmark, or only the logo if space is tight; make the two chips
   (flame, stars) smaller so nothing is truncated at 360 px.
2. The sticky "Reprendre" button still covers the last card ("Apres
   famille 1 - Les voyelles courtes"). Add scroll padding-bottom =
   button height + nav height + 24 px and a 24 px fade above the button.

The last card must be fully visible when scrolled to the end.

3. The first-run tip ("Touche ici pour lancer ta lecon...") overlays the
   Defi card and points at nothing. Make it a coach-mark: a bubble with
   an arrow pointing at the "Reprendre" button, dismissible with OK, shown
   once.

PHASE D - VOIR (animation) POLISH

1. The phone has reduced motion on, so the hint "Animations reduites :
   appuie sur Rejouer" appears and the animation does not start by
   itself. The stroke-order animation is lesson content: AUTO-PLAY once
   on entering the step even when reduced motion is on. Keep the hint
   only as a small icon tooltip, not a text line.
2. The ink is still too heavy (Alif looks like a fat pill). Stroke width
   about 7 percent of glyph height, tapered ends. Re-check Taa: the bowl
   is flatter than the real letter; deepen the curve

slightly and keep the
start at the right.

3. The ant must not hide the start badge or stand on top of the dots.

PHASE E - PROGRESSIVE RULE VIOLATIONS AND QUIZ

1. The family exam asks about Thaa while Thaa is still locked ("Demain :
   Thaa"). Exams may only use UNLOCKED letters. The family exam button is
   enabled only when all letters of the family are unlocked and done;
   before that it shows a padlock with "Termine les 4 lettres".
2. "Passer l'examen final" is visible at 3/28 letters. Hide it or show it
   locked with "28 lettres necessaires".
3. Quiz "Quel mot correspond a la lettre Thaa ?" shows only French words
   (maison / renard / pomme). Show each option as picture + Arabic word
   with the French word in small text, so the learner practices reading.
   The second question ("Comment s'appelle cette lettre ?") offers three

plain text buttons: add the speaker button as an answer mode (hear the
name and pick) in the question mix.

4. Practice history saved "100 percent" for a quick trace. Log the real
coverage and outside ratios, show the real score, and only save an
attempt at 60 percent or more.

MANDATORY SELF-CHECK BEFORE YOU SAY "DONE"

Update /dev/selftest and print PASS/FAIL with measured values:

1. Tracing screen at 360x740 and 390x844: no truncated or overlapping
text; canvas width >= 85 percent; at most 3 buttons under the canvas.
2. Dots: simulated taps on all targets give the right count for Taa,
Thaa, Qaaf, Yaa; off-target taps are ignored; no double counting
(print taps received vs dots counted).
3. Home: "Nouqta" fully visible; last card fully visible at scroll end;
coach-mark points at Reprendre.

4. Voir auto-plays with reducedMotion forced on (print progress at
   0 / 500 / 1500 ms).
5. Exams: with 3 letters unlocked, no question mentions a locked letter;
   final exam is locked until 28 letters.
6. Quiz options show picture + Arabic + French.
7. Practice scores: print coverage/outside values for 3 attempts.
8. Tap targets >= 48 px; no English words in the UI.
   End with: (a) the table, (b) every failure and its fix, (c) root causes
   of the dots bug and the overlap, (d) anything you could NOT verify,
   (e) a short "Suggestions" list.
